

We share an intuitive need to shape our immediate environment. It is an object of this design to provide a means of allowing unforeseen results. Interlocking light emitting 'scales' are joined by universal connectors, feeding power through the structure. These connectors are designed to give the user great flexibility, whilst making it impossible to feed the scales with incorrect polarity.

The modular nature of the concept is to allow an infinite diversity through the use of different combinations of elements. On a large grid individual scales are effectively wired in parallel, power may be fed into any individual scales on the grid. Scales may vary in size whilst conforming to a master module, allowing apparently fractal patterns to emerge from an apparently ordered grid. An essentially flat form is to allow an even spread of light, although individual scales may vary in both colour and intensity. The intention is to sell the product as a sort of leggo of form and light.

Positive polarity
Negative polarity

Electrically & mechanically linked 'scales' may form wall or ceiling mounted tapestries of diffuse light.
